In the Claims:

Please amend the claims as follows:

1. (Currently Amended) An apparatus for controlling the composition of gases within a container,

said container including a plurality of walls, and at least one inlet, and/or outlet, or inlet and outlet,

the apparatus including at least one sensor, at least one controller and at least one gas permeable membrane being adapted to facilitate the passage there through of different molecules at different rates,

said membrane defining a first region and a second region, the first region being for holding cargo and the second region defining a gas buffer region, said at least one inlet, and/or outlet, or inlet and outlet being in communication with said buffer region.

- 2. (Previously Presented) An apparatus according to claim 1, wherein at least one of said at least one inlet, and/or outlet, or inlet and outlet includes a valve.
- 3. (Currently Amended) An apparatus according to claims 1 or 2 claim 1, which includes at least two inlets, and/or two outlets, or two inlets and outlets.
- 4. (Currently Amended) An apparatus according to claims 1, 2 or 3 claim 1, wherein said membrane being is selectively permeable.
- 5. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein a valve is adapted to open when activated by the controller to provide a passage through which gases flow into, and/or out of, or into and out of the container.
- 6. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein the controller is adapted to open a valve when the <u>a</u> concentration or volume of gas within the container reaches or falls to a specified level.

- 7. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein the container is a building.
- 8. (Previously Presented) An apparatus according to claim 7 wherein the building is a cool store.
- 9. (Currently Amended) An apparatus according to any of the claims 1-8 claim 1, wherein the apparatus is adapted to provide an apparatus for a transportation or shipping container, said container being substantially rectangular in shape and include including two side walls, a roof, a floor, a rear wall and a front wall where the rear wall also doubles as a door or entrance provides access into the an interior of the container.
- 10. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein the inlet may be joined with an outlet to provide a bidirectional flow means.
- 11. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein the container incorporating comprises one bi-directional flow means located at the rear of the container and one bi-directional flow means located at the front of the container, and each of said bi-directional flow means including one valve.
- 12. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein said selectively permeable membrane being is formed from a polymeric film, such as plastic, which is adapted for gas permeation.
- 13. (Previously Presented) An apparatus according to claim 12, wherein said polymeric film being more permeable to carbon dioxide than to oxygen gas.
- 14. (Currently Amended) An apparatus according to claims 12 or 13 claim 12, wherein said polymeric film being positioned to affix to the base and roof of the container, as well as the two sidewalls of the container and thereby is affixed to at least a portion of a base, a roof and two sidewalls of the

container, the polymeric film dividing the container into two regions, the first region being adapted as a storage compartment and being located near the front of the container, and the second being adapted as a gas buffer region being located at the rear of near the door end of the container.

- 15. (Currently Amended) An apparatus according to any of the claims 12, 13 or 14 claim 12, wherein said polymeric film being is located substantially near the a rear portion of the container.
- 16. (Currently Amended) An apparatus according to any of the elaims 11-15 claim 12, wherein said polymeric film being located to provides a void or buffering region around at least one bi-directional flow means which is adapted to control the flow of gas into the buffer region and the flow of gases out of the buffer region both into the storage compartment and completely out of the container.
- 17. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein said gas permeable film being membrane is adapted to facilitate the flow of carbon dioxide from the cargo compartment of the container to the gas buffer region of the container.
- 18. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein said gas permeable film being membrane is adapted to facilitate the flow of oxygen from the gas buffer region of the container to the storage compartment of the container.
- 19. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein said gas permeable film being membrane is adapted to allow oxygen to flow through it the membrane, provided that the oxygen flow direction of such flow is opposite to that of the carbon dioxide flow.
- 20. (Currently Amended) An apparatus according to any of the preceding claims claim 1, wherein a sensor located within the container being adapted to sense the a concentration, and/or volumes or concentration and

<u>volumes</u> of carbon dioxide, <u>and/or</u> oxygen <u>or carbon dioxide and oxygen</u> within the cargo storage compartment of a <u>the</u> container.

- 21. (Currently Amended) An apparatus according to any of the preceding claims claim 1, comprising bi-directional flow means located near the a rear end of the container, said bi-directional flow means being able to open to allow gas to flow into the buffer region.
- 22. (Currently Amended) An apparatus according to any of the preceding claims claim 1, comprising bi-directional flow means located near the a rear end of the container, said bi-directional flow means being able to open an inlet so that gas may flow into the cargo region of the container.
- 23. (Currently Amended) An apparatus according to any of the preceding claims claim 1, comprising bi-directional flow means located near the a front end of the container, said bi-directional flow means being able to open to allow gas to flow into the buffer region.
- 24. (Currently Amended) An apparatus according to any of the preceding claims claim 1, comprising bi-directional flow means located near the a front end of the container, said bi-directional flow means being able to open an inlet so that gas may flow into the cargo region of the container.
- 25. (Currently Amended) A container having a plurality of walls, and at least one inlet, and/or outlet, or inlet and outlet, including an apparatus for controlling the a composition of gases within the container,

the apparatus including at least one sensor, at least one controller and at least one gas permeable membrane being adapted to facilitate the passage there through of different molecules at different rates.

said membrane defining a first region and a second region, the first region being for holding cargo and the second region defining a gas buffer region,

said at least one inlet, and/or outlet, or inlet and outlet being in communication with said buffer region.

Preliminary Amendment December 7, 2005

- 26. (Previously Presented) A container according to claim 25, wherein said membrane defines a gas buffer region located inside said container.
- 27. (Currently Amended) A container according to claims 25 or 26 claim 25, wherein said membrane defines a gas buffer region located on the exterior of said container.
